

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

Read more about Early Journal Content at <http://about.jstor.org/participate-jstor/individuals/early-journal-content>.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

XXVI. *An Investigation of a general Theorem for finding the Length of any Arc of any Conic Hyperbola, by Means of Two Elliptic Arcs, with some other new and useful Theorems deduced therefrom.* By John Landen, F.R.S.

Redde, Mar. 23, 1775. **I**N a paper, which the Society did me the honour to publish in the Philosophical Transactions for the year 1771, I announced, that I had discovered a general theorem for finding the length of any arc of any conic hyperbola, by means of two elliptic arcs; and I promised to communicate the investigation of such theorem. I now purpose to perform my promise; and, being pleased with the discovery (by which we are enabled to bring out very elegant conclusions in many interesting enquiries, as well mechanical as purely geometrical), I cannot but flatter myself, that what I am about to communicate will be acceptable to gentlemen who are curious in such inquiries.

1. From the theorem taken notice of in Art. 1. of the paper I have just now mentioned, it follows, that in the hyperbola AD (TAB. VII. fig. 1.), if the semi-transverse axis $Ac be = m - n$; the semi-conjugate $= 2 \times \sqrt{mn}^{\frac{1}{2}}$; and the perpendicular CP, from the center c upon the tangent DP, $= \sqrt{(m-n)^2 - t^2}^{\frac{1}{2}}$; the difference (DP-AD) between the said tangent

tangent DP and the arc AD will be equal to the fluent of

$$\frac{\sqrt{m-n^2-t^2}}{\sqrt{m+n^2-t^2}} \times \dot{t}.$$

2. It is well known, that in any ellipsis whose semi-transverse axis is m , and semi-conjugate n ; if x be the abscissa, measured from the center upon the transverse axis, and z the arc between the conjugate axis and the ordinate corresponding to x , $\frac{\sqrt{m^2-gx^2}}{m^2-x^2} \times \dot{x}$ will be $= \dot{z}$,

$$g \text{ being } = \frac{m^2-n^2}{m^2}.$$

$$\text{Hence, } \frac{\sqrt{m+n^2-t^2}}{\sqrt{m-n^2-t^2}} \times \dot{t} \text{ being } = \frac{\sqrt{m+n^2-t^2}}{\sqrt{m+n^2-\frac{m+n}{m-n}t^2}} \times \frac{m+n}{2m-n} \dot{t}, \text{ it}$$

appears, that in the ellipsis aed (fig. 2.) whose semi-transverse axis cd is $= m+n$, semi-conjugate $ca = 2 \times mn^{\frac{1}{2}}$, and abscissa cb (corresponding to the ordinate be)

$$= \frac{m+n}{m-n} t; \text{ the arc } ae \text{ is equal to the fluent of } \frac{\sqrt{m+n^2-t^2}}{\sqrt{m-n^2-t^2}} \times \dot{t}.$$

3. In the ellipsis $aefd$ (fig. 3.), the semi-transverse axis cd being $= m$; the semi-conjugate $ca = n$; and the abscissa cb (corresponding to the ordinate be) $= x$; if ep , the tangent at e , intercepted by a perpendicular (cp) drawn thereto from the center c , be denoted by t ; $gx \times \frac{\sqrt{m^2-x^2}}{m^2-gx^2} \dot{x}$ (as is well known) will be $= \dot{t}$, g being as in the preceding article.

Hence

Hence $x^2 = \frac{m^2 g + t^2}{2g} - \frac{\overline{m^2 - n^2}^2 - 2 \times m^2 + n^2 \times t^2 + t^4}{2g}^{\frac{1}{2}}$. From

which equation, by taking the fluxions, we have,

$$\begin{aligned} x \dot{x} &= \frac{t \dot{t}}{2g} + \frac{\overline{m^2 + n^2} \times t \dot{t} - t^3 \dot{t}}{2g \times \overline{m^2 - n^2}^2 - 2 \times m^2 + n^2 \times t^2 + t^4}^{\frac{1}{2}} \\ &= \frac{t \dot{t}}{2g} + \frac{\overline{m^2 + n^2} \times t \dot{t} - t^3 \dot{t}}{2g \times \overline{m - n^2}^2 - t^2 \times \overline{m + n^2}^2 - t^2}^{\frac{1}{2}}. \text{ But } \dot{z} \text{ being } = \frac{\overline{m^2 - g x^2}}{m^2 - x^2}^{\frac{1}{2}} \times \dot{x}, \end{aligned}$$

as observed in the preceding article, it appears that

$\frac{g}{t} \times x \dot{x}$ is $= \dot{z}$. It is obvious, therefore, that

$$\begin{aligned} \dot{z} \text{ is } &= \frac{1}{2} \dot{t} + \frac{1}{2} \times \frac{\overline{m^2 + n^2} \times t \dot{t} - t^3 \dot{t}}{\overline{m - n^2}^2 - t^2 \times \overline{m + n^2}^2 - t^2}^{\frac{1}{2}} \\ &= \frac{1}{2} \dot{t} + \frac{1}{4} \times \frac{\overline{m - n^2}^2 \times t \dot{t} - t^3 \dot{t}}{\overline{m - n^2}^2 - t^2 \times \overline{m + n^2}^2 - t^2}^{\frac{1}{2}} + \frac{1}{4} \times \frac{\overline{m + n^2}^2 \times t \dot{t} - t^3 \dot{t}}{\overline{m - n^2}^2 - t^2 \times \overline{m + n^2}^2 - t^2}^{\frac{1}{2}} \\ &= \frac{1}{2} \dot{t} + \frac{1}{4} \times \frac{\overline{m - n^2}^2 - t^2}{\overline{m + n^2}^2 - t^2}^{\frac{1}{2}} \times \dot{t} + \frac{1}{4} \times \frac{\overline{m + n^2}^2 - t^2}{\overline{m - n^2}^2 - t^2}^{\frac{1}{2}} \times \dot{t}. \text{ From whence} \end{aligned}$$

taking the fluents by the theorems in art. 1. and 2. we

have $z = ae$ (fig. 3.) $= \frac{1}{2} t + \frac{DP - AD}{4}$ (fig. 1.) $+ \frac{ae}{4}$ (fig. 2.)

consequently the hyperbolic arc AD is $= DP + ae + 2t - 4ae$.

Thus, beyond my expectation, I find, that the hyperbola may in general be rectified by means of two ellipses.

Writing E and F for the quadrantal arcs ad, ad, (fig. 2. and 3.) respectively, and L for the limit of the difference DP - AD, whilst the point of contact (D) is supposed to be carried to an infinite distance from the vertex A of the hyperbola (fig. 1.), we find

$$2F - E = L,$$

the value of ae being $= \frac{1}{4} F + \frac{1}{4} m - \frac{1}{2} n$ when t is $= m - n$;

that is, when e coincides with d (fig. 2.), and p with c (fig. 1.), by what I have proved in the before mentioned paper, art. 10.

4. From what is done above, the following useful theorems are deduced.

THEOREM I.

The fluent of $\frac{1}{2}a^{\frac{1}{2}}z^{-\frac{1}{2}} \times \frac{\sqrt{\frac{b^2}{a^2} + z}}{a - z}$ is = de.

THEOREM II.

The fluent of $\frac{1}{2}a^{\frac{1}{2}}z^{-\frac{1}{2}} \times \frac{\sqrt{\frac{a^2}{b^2} - z}}{\frac{a}{b^2} + z}$ is $= \frac{2a^2}{b^2 + 1} \cdot de - \frac{2a^2}{b^2 + 2} \cdot ef$.

THEOREM III.

The fluent of $\frac{\frac{1}{2}a^{\frac{1}{2}}z^{\frac{1}{2}}}{b^2 + 2kz - z^2}$ is $= 2ef - de = 2F - E + AD - DP$.

THEOREM IV.

The fluent of $\frac{\frac{1}{2}a^{-\frac{1}{2}}b^2z^{-\frac{1}{2}}}{b^2 + 2kz - z^2}$ is $= 2 \times de - ef$. N.B. $k = \frac{a^2 - b^2}{2a}$.

These theorems still refer to fig. 1. 2. 3.; but now the values of the several lines therein (being not as before) are as here specified; *videlicet*,

Fig. 1. In the hyperbola AD, the femi-transverse axis AC is now = a; the femi-conjugate = b; the perpendicular CP, from the center c upon the tangent DP, is $= \sqrt{a^2 z^{\frac{1}{2}}}$ the said tangent DP $= \frac{a^{\frac{1}{2}}}{z^{\frac{1}{2}}} \times \sqrt{b^2 + 2kz - z^2}$; and the abscissa CB (corresponding to the ordinate BD) is $= \frac{a^{\frac{1}{2}}}{z^{\frac{1}{2}}} \times \frac{\sqrt{az + b^2}}{a^2 + b^2}$

Fig.

Fig. 2. In the ellipsis aed, the semi-transverse axis cd is $= \sqrt{a^2 + b^2}^{\frac{1}{2}}$; the semi-conjugate ca = b; the abscissa cb $= \frac{\sqrt{a^2 + b^2}^{\frac{1}{2}}}{a} \times \sqrt{a - x}^{\frac{1}{2}}$; and the ordinate be $= b \times \frac{x}{a}^{\frac{1}{2}}$.

Fig. 3. In the ellipsis aefd, the semi-transverse axis cd is $= \frac{1}{2} \sqrt{a^2 + b^2}^{\frac{1}{2}} + \frac{1}{2} a$; the semi-conjugate ca $= \frac{1}{2} \sqrt{a^2 + b^2}^{\frac{1}{2}} - \frac{1}{2} a$; the tangents ep, fq, intercepted by perpendiculars (cp, cq) drawn thereto from the center c, each $= a^{\frac{1}{2}} \times \sqrt{a - x}^{\frac{1}{2}}$; and the abscissa (c b' or c b'') on cd, corresponding to the point e or f, of the curve is determined by the expression

$$\frac{\sqrt{a^2 + b^2}^{\frac{1}{2}} + a - x \mp x^2 + \frac{b^2}{a} x^{\frac{1}{2}}}{2^{\frac{1}{2}} + \sqrt{a^2 - b^2}^{\frac{1}{2}}} \times cd.$$

The quadrantal arc ad (fig. 2.) is denoted by E; and the quadrantal arc ad (fig. 3.) is denoted by F. L the limit of DP - AD (fig. 1.) is $= 2 F - E$.

From what is now done, I might proceed to deduce many other new theorems, for the computation of fluents; but I shall, at present, decline that business: and, after giving a remarkable example of the use of theorem 4. in computing the descent of a heavy body in a circular arc, conclude this paper with a few observations relative to the contents of the preceding articles.

5. Let lpqn (fig. 4.) be a semi-circle perpendicular to the horizon, whose highest point is l, lowest n, and center m. Let ps, qt, parallel to the horizon, meet the diameter lmn in s and t; and let the radius lm (or mn) be denoted by r; the height ns by d; and the distance

st by x . Then, putting b for $(16\frac{1}{12}$ feet) the space a heavy body, descending freely from rest, falls through in one second of time; and supposing a pendulum, or other heavy body, descending by its gravity from p , along the arc pqn , to have arrived at q ; the fluxion of the time

of descent will be $= \frac{\frac{1}{2}rb^{-\frac{1}{2}}x^{-\frac{1}{2}}}{2rd-d^2-2.r-d.x-x^2)^{\frac{1}{2}}}$. The fluent

whereof, or the time of descent from p to q is (by theor. 4. of the preceding article) $= \frac{2r}{b^{\frac{1}{2}} \times 2r-d} \times de-ef$.

a (in that theorem) being taken $= d^{\frac{1}{2}}$, $b = 2r-d)^{\frac{1}{2}}$, cb (fig. 2.) $= \frac{2r}{d})^{\frac{1}{2}} \times \overline{d-x}^{\frac{1}{2}}$, and ep , fq , (fig. 3.) each $= \overline{d-x})^{\frac{1}{2}}$.

Hence it appears, that the whole time of descent from p to n is $= \frac{2r}{b^{\frac{1}{2}} \times 2r-d} \times E-F$; when, in fig. 2. and 3. the semi-axes are taken according to the values of a and b just now specified.

6. If pqn be a quadrant; that is, if d be $= r$, the whole time of descent from p to n will be $= \frac{2}{b^{\frac{1}{2}}} \times E-F$, by the

above theorem. Which time, by what I have shewn in the Philof. Transact. for 1771, is $= \frac{1}{b^{\frac{1}{2}}} \times \frac{1}{2}E + \frac{1}{2}\sqrt{E^2-2c}$,

c being $\frac{1}{4}$ of the periphery of the circle whose radius is r .

Consequently, $\frac{2}{b^{\frac{1}{2}}} \times E-F$ being found $= \frac{1}{b^{\frac{1}{2}}} \times \frac{1}{2}E + \frac{1}{2}\sqrt{E^2-2c}$,

we find from that equation $F = \frac{3}{4}E - \frac{1}{4}\sqrt{E^2-2c}$, where E is the quadrantal arc of the ellipsis, whose semi-transverse and semi-conjugate axes are $2r$ and $r^{\frac{1}{2}}$; and F the qua-

drantal arc of another ellipsis, whose semi-transverse and semi-conjugate axes are $\sqrt{\frac{r}{2}} + \frac{1}{2}r^{\frac{1}{2}}$ and $\sqrt{\frac{r}{2}} - \frac{1}{2}r^{\frac{1}{2}}$.

Before Mr. MACLAURIN published his excellent Treatise of Fluxions, some very eminent mathematicians imagined, that the *elastic curve* could not be constructed by the quadrature or rectification of the conic sections. But that gentleman has shewn, in that treatise, that the said curve may in every case be constructed by the rectification of the hyperbola and ellipsis; and he has observed, that, by the same means, we may construct the curve along which, if a heavy body moved, it would recede equally in equal times from a given point. Which last mentioned curve Mr. JAMES BERNOULLI constructed by the rectification of the elastic curve, and Mr. LEIBNITZ and Mr. JOHN BERNOULLI by the rectification of a geometrical curve of a higher kind than the conic sections. It is observable, that Mr. MACLAURIN's method of construction just now adverted to, though very elegant, is not without a defect. The difference between the hyperbolic arc and its tangent being necessary to be taken, the method always fails when some principal point in the figure is to be determined; the said arc and its tangent then both becoming infinite, though their difference be at the same time finite. The contents of this paper, properly applied, will evince, that both the *elastic curve* and the *curve of equable recess from a given point* (with many others) may be constructed by the rectification of the ellipsis only, without failure in any point
